

Higgs branching ratio analysis - status report

Victoria Martin, on behalf of:

**Clare Lynch, Joel Goldstein, Mark Grimes,
University of Bristol**

**VM, Hajrah Tabassam, Roberval Walsh
University of Edinburgh**

Strategy

- Looking at Z-Higgs events with $m_H = 120 \text{ GeV}/c^2$, $\sqrt{s} = 230$ or 250 GeV .
- Z decays $Z \rightarrow \mu^+\mu^-$ or $Z \rightarrow e^+e^-$
- We are currently using our own samples, (mainly) generated with
 - Mokka 06-06-p03
 - LDCPrime_02Sc
 - ILCSoft 01-03-06
 - Bremstrahlung spectrum taken from Pandora-Pythia and given to Pythia. (WE KNOW THIS IS NOT IDEAL!)
- We will move to using the mass production sample as soon as available
- We are working on different parts of the analysis, with the aim of working out an overall strategy. Present some of our results here.

Contents

- Muon and Electron ID cuts
- Z reconstruction
- Recoil mass
- B- and C-jet tagging
- Separating signal, background and decay channels
- Conclusions

Lepton ID cuts

Hajrah Tabassam

- First iteration tuned on single particle samples with $45 < p / \text{GeV} < 60$
- Extract from PandoraPF0 collection:
 - E_{ECAL}
 - E_{HCAL}
 - p

$$E_{\text{TOT}} = E_{\text{ECAL}} + E_{\text{HCAL}}$$

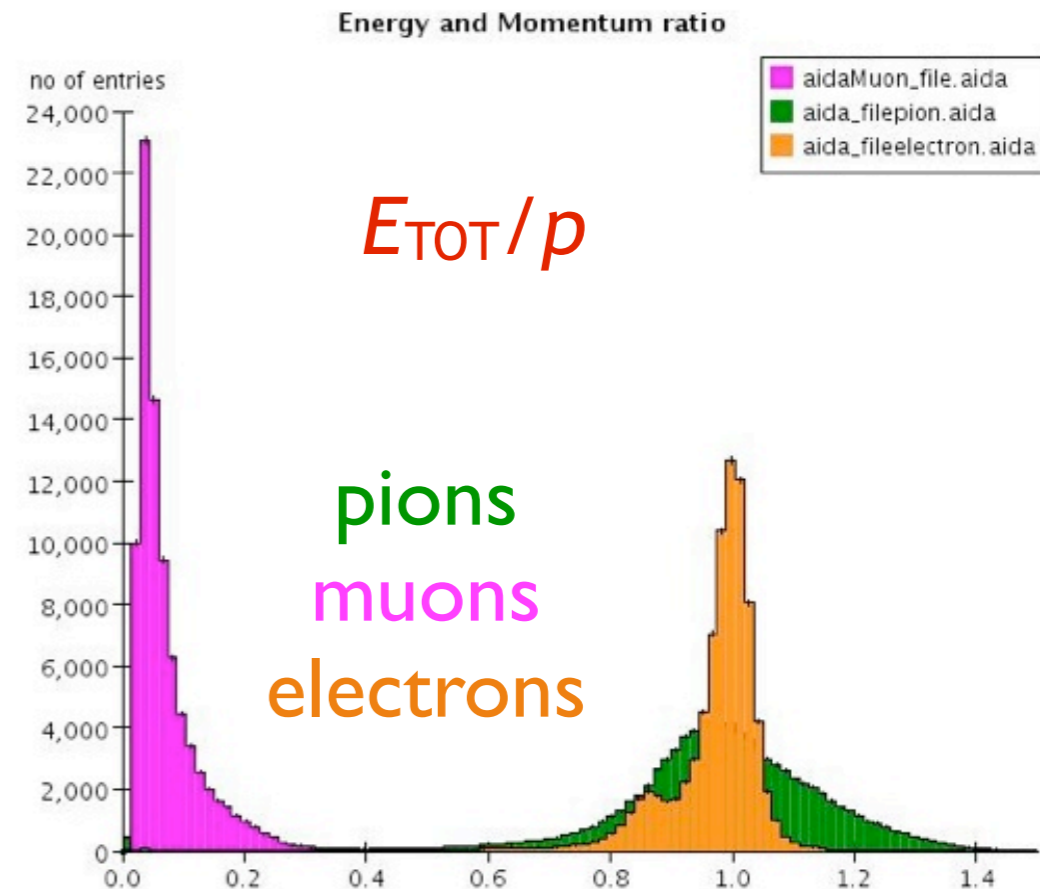

Electron cuts

- 1) $E_{\text{ECAL}}/E_{\text{TOT}} > 0.7$
- 2) $E_{\text{TOT}}/p > 0.9$

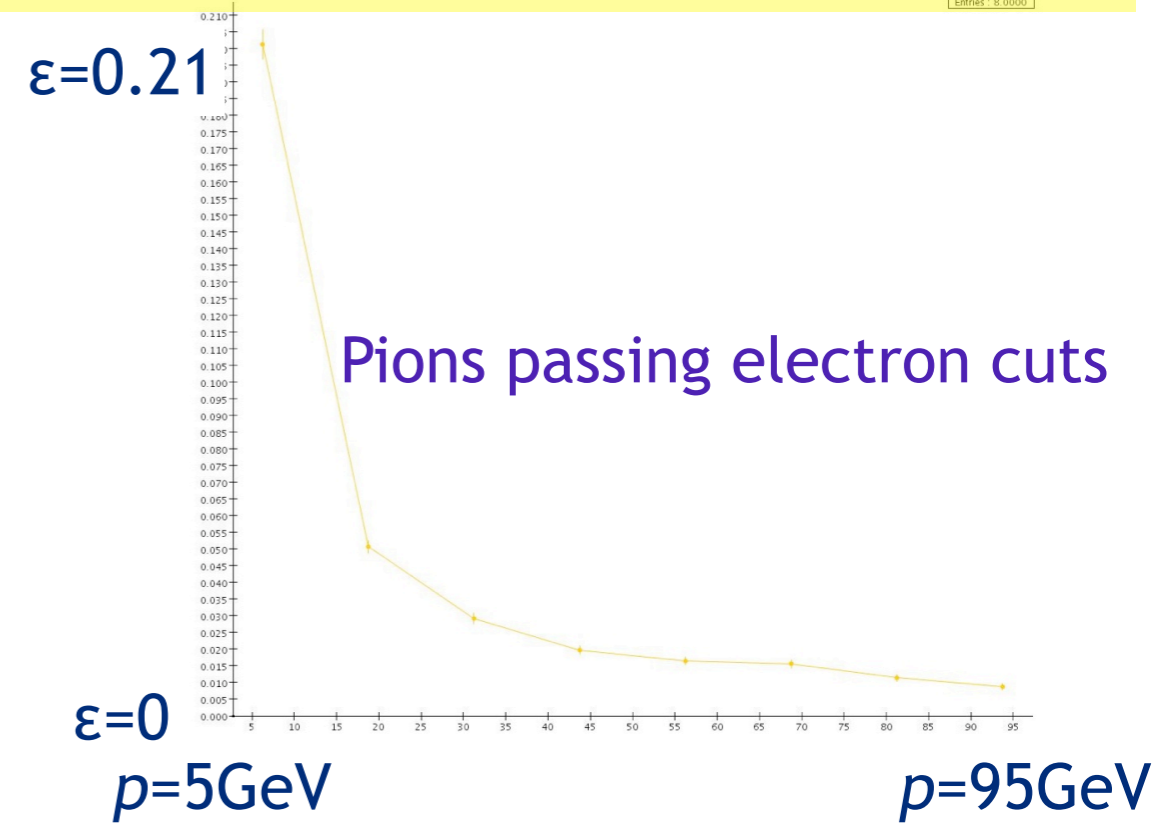

Muon cuts

- 1) $E_{\text{ECAL}} < 2.5 \text{ GeV}$
- 2) $E_{\text{HCAL}} < 15 \text{ GeV}$
- 3) $E_{\text{ECAL}}/E_{\text{TOT}} < 0.5$
- 4) $E_{\text{TOT}}/p < 0.3$

efficiencies in %	electron cuts	muon cuts
e	98.57 ± 0.06	~ 0
μ	0.03 ± 0.01	97.5 ± 0.05
π	3.88 ± 0.06	0.46 ± 0.003

Electron ID as a function of $\cos \theta$ and momentum

- Work underway refining cuts and calculate efficiency for muons from $Z(\rightarrow\mu^+\mu^-)H$ events.

$Z \rightarrow \mu^+ \mu^-$ reconstruction

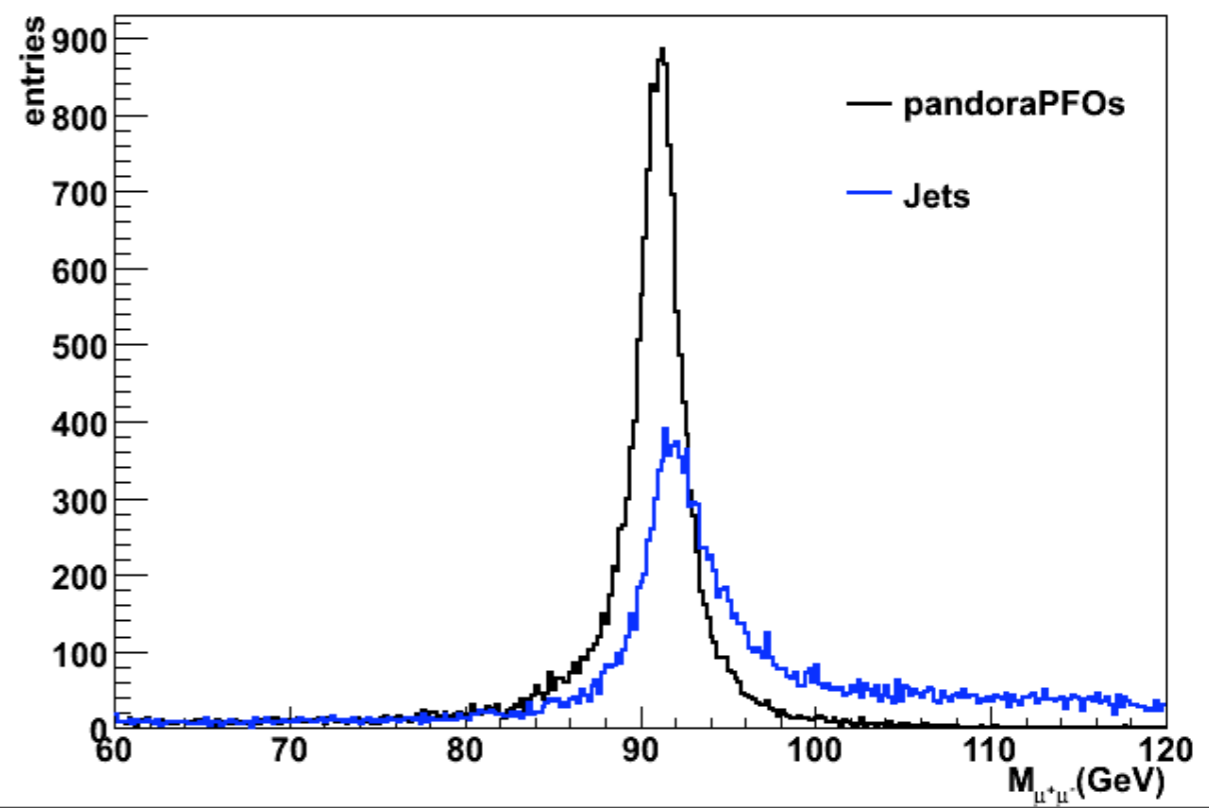

Roberval Walsh

- Use the muon ID selection to identify RecoParticles as muons
- Using individual PandoraPF0s, as opposed to clustered jets, results in best resolution

Mass of the Z boson

Mass of the Z boson ($\sqrt{s} = 230$ GeV)

One $Z \rightarrow \mu^+ \mu^- H \rightarrow b \bar{b}$ event

- Conclusion: we need to remove the two identified muons and re-cluster the jets
- We will investigate clustering with 2-jets forcing and using a y -cut.
- Removal of leptons be more tricky for $Z \rightarrow e^+ e^-$

Recoil Mass reconstruction

Recoil mass

Recoil mass (sqrt(s) = 230 GeV)

Recoil Mass reconstruction cont.

- We are considering cutting on Z boson energy to get remove beamstrahlung +ISR tail
 - Trade systematics by statistics?
 - Better significance?

Recoil mass (sqrt(s) = 230 GeV)

Recoil mass ($E_Z > 100$ GeV)

hRecoilMass	
Entries	7921
Mean	120.7
RMS	1.399
χ^2 / ndf	32.37 / 31
Constant	439.5 ± 6.4
Mean	120.6 ± 0.0
Sigma	1.463 ± 0.016

Fit to $E_Z > 100$ GeV events
Mean: 120.6 GeV
 σ : 1.46 GeV

Jet tagging

- Using the information from LCFIVertex collection information for Durham_4Jets collections.
- To examine quality of tagging look at jets identified as true b-jets or c-jets (from MC)
- Tagging isn't optimum for this sample...
- We intend to retune the tagging and re-run

Separating Signal and ZZ background: lepton kinematics

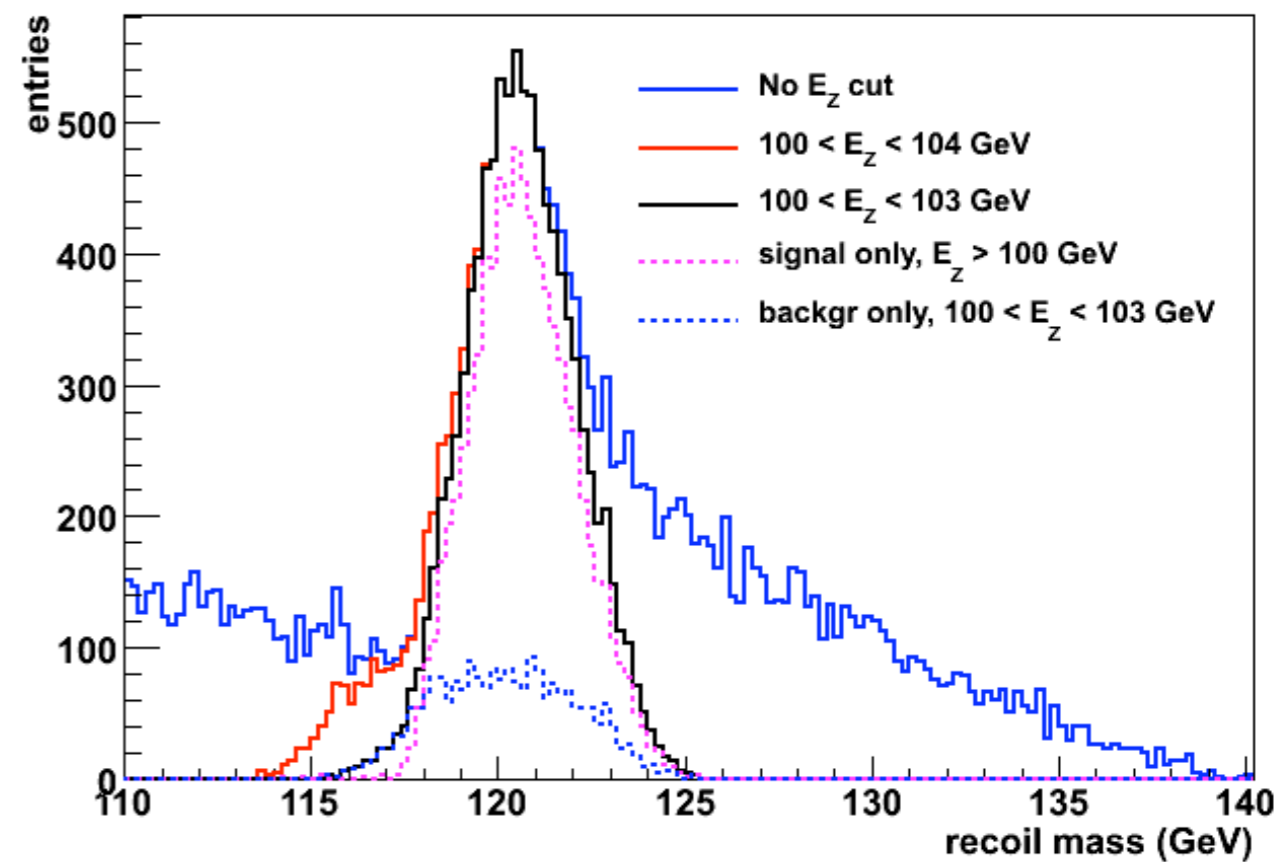

Roberval Walsh

- First use a kinematic separation of ZH and ZZ
- Cut on $E_Z > 100$ GeV, significantly reduces ZZ background.

Energy of the Z boson (sqrt(s) = 230 GeV)

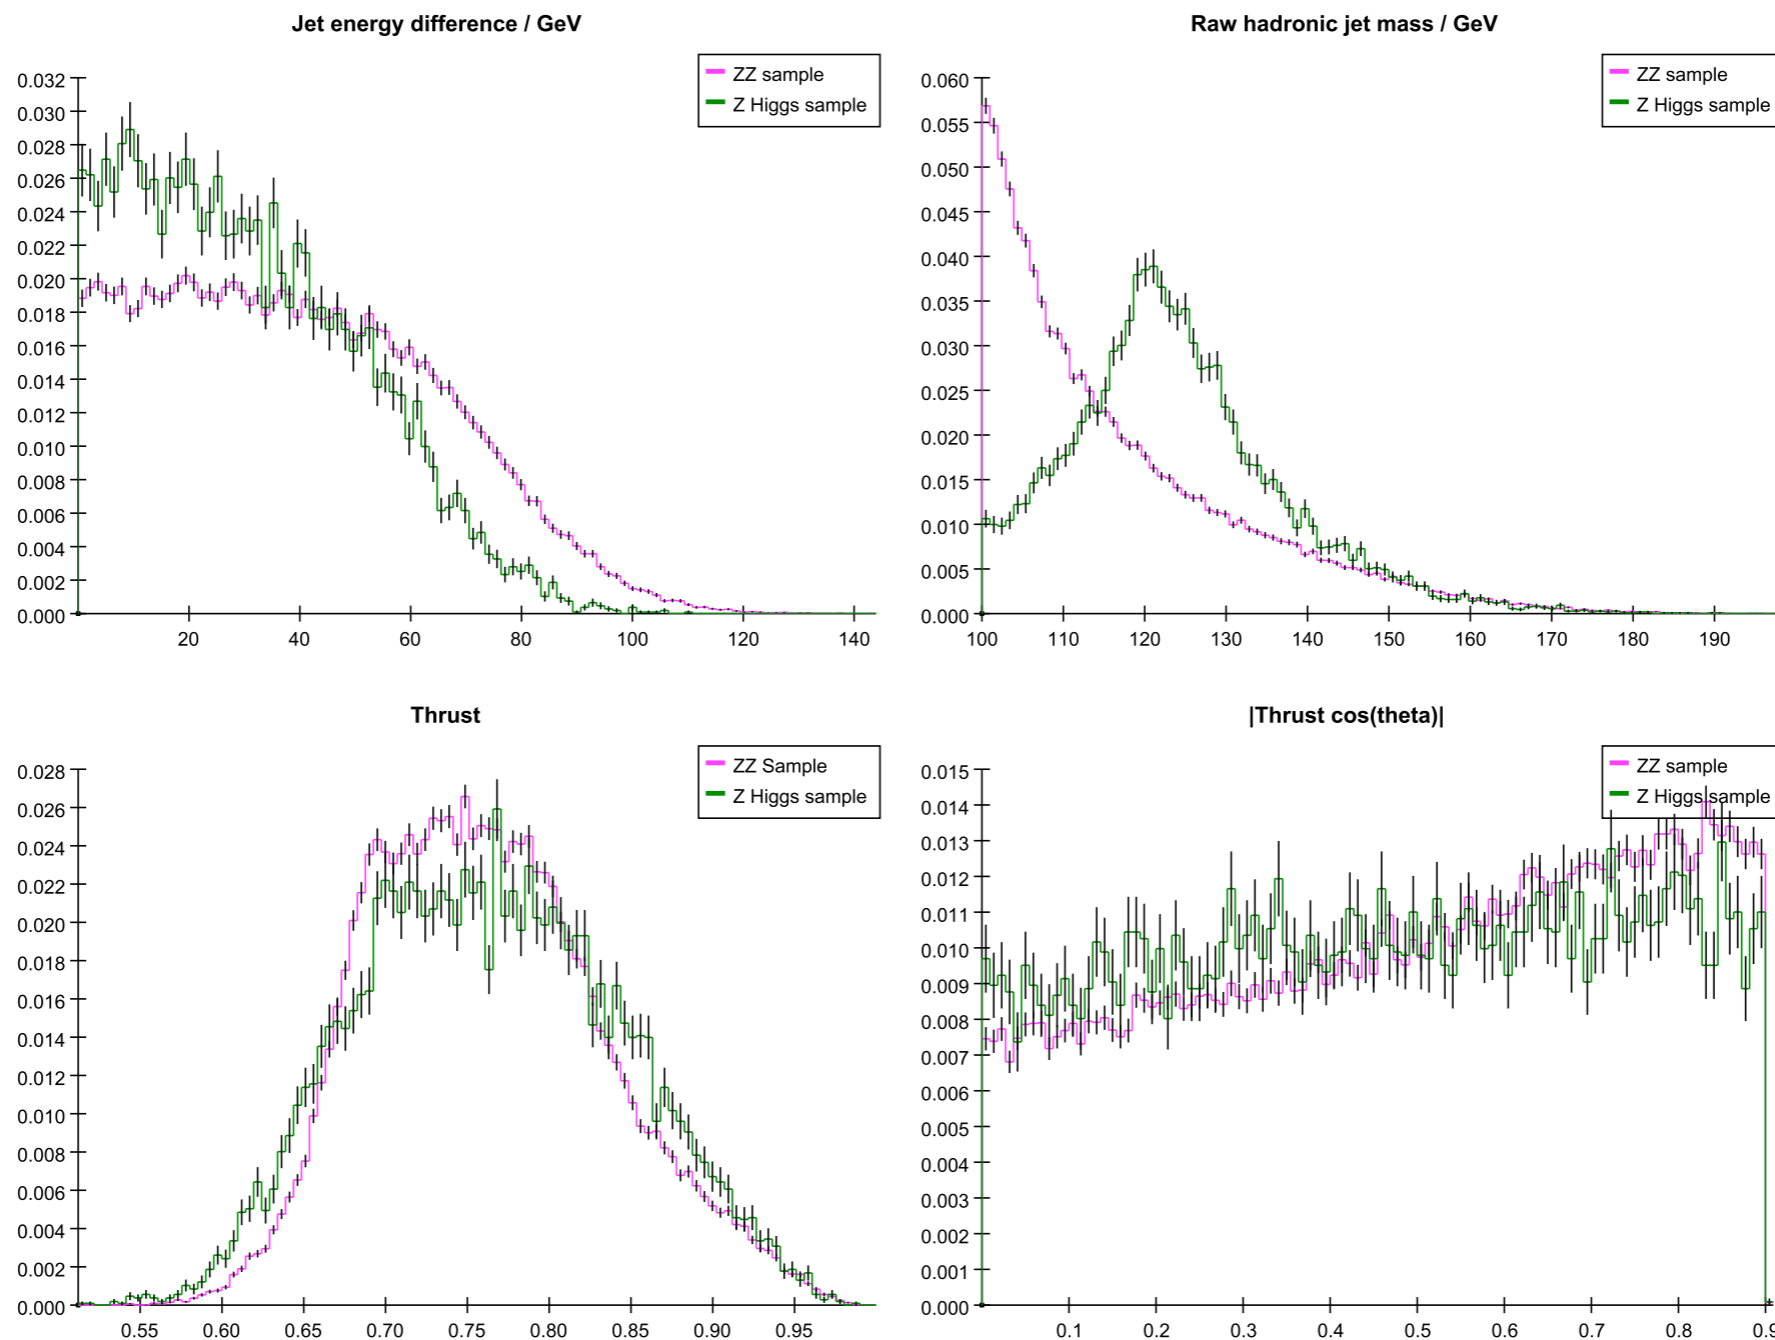

Recoil mass (sqrt(s) = 230 GeV)

Separating Signal and ZZ background: jet kinematics

Mark Grimes

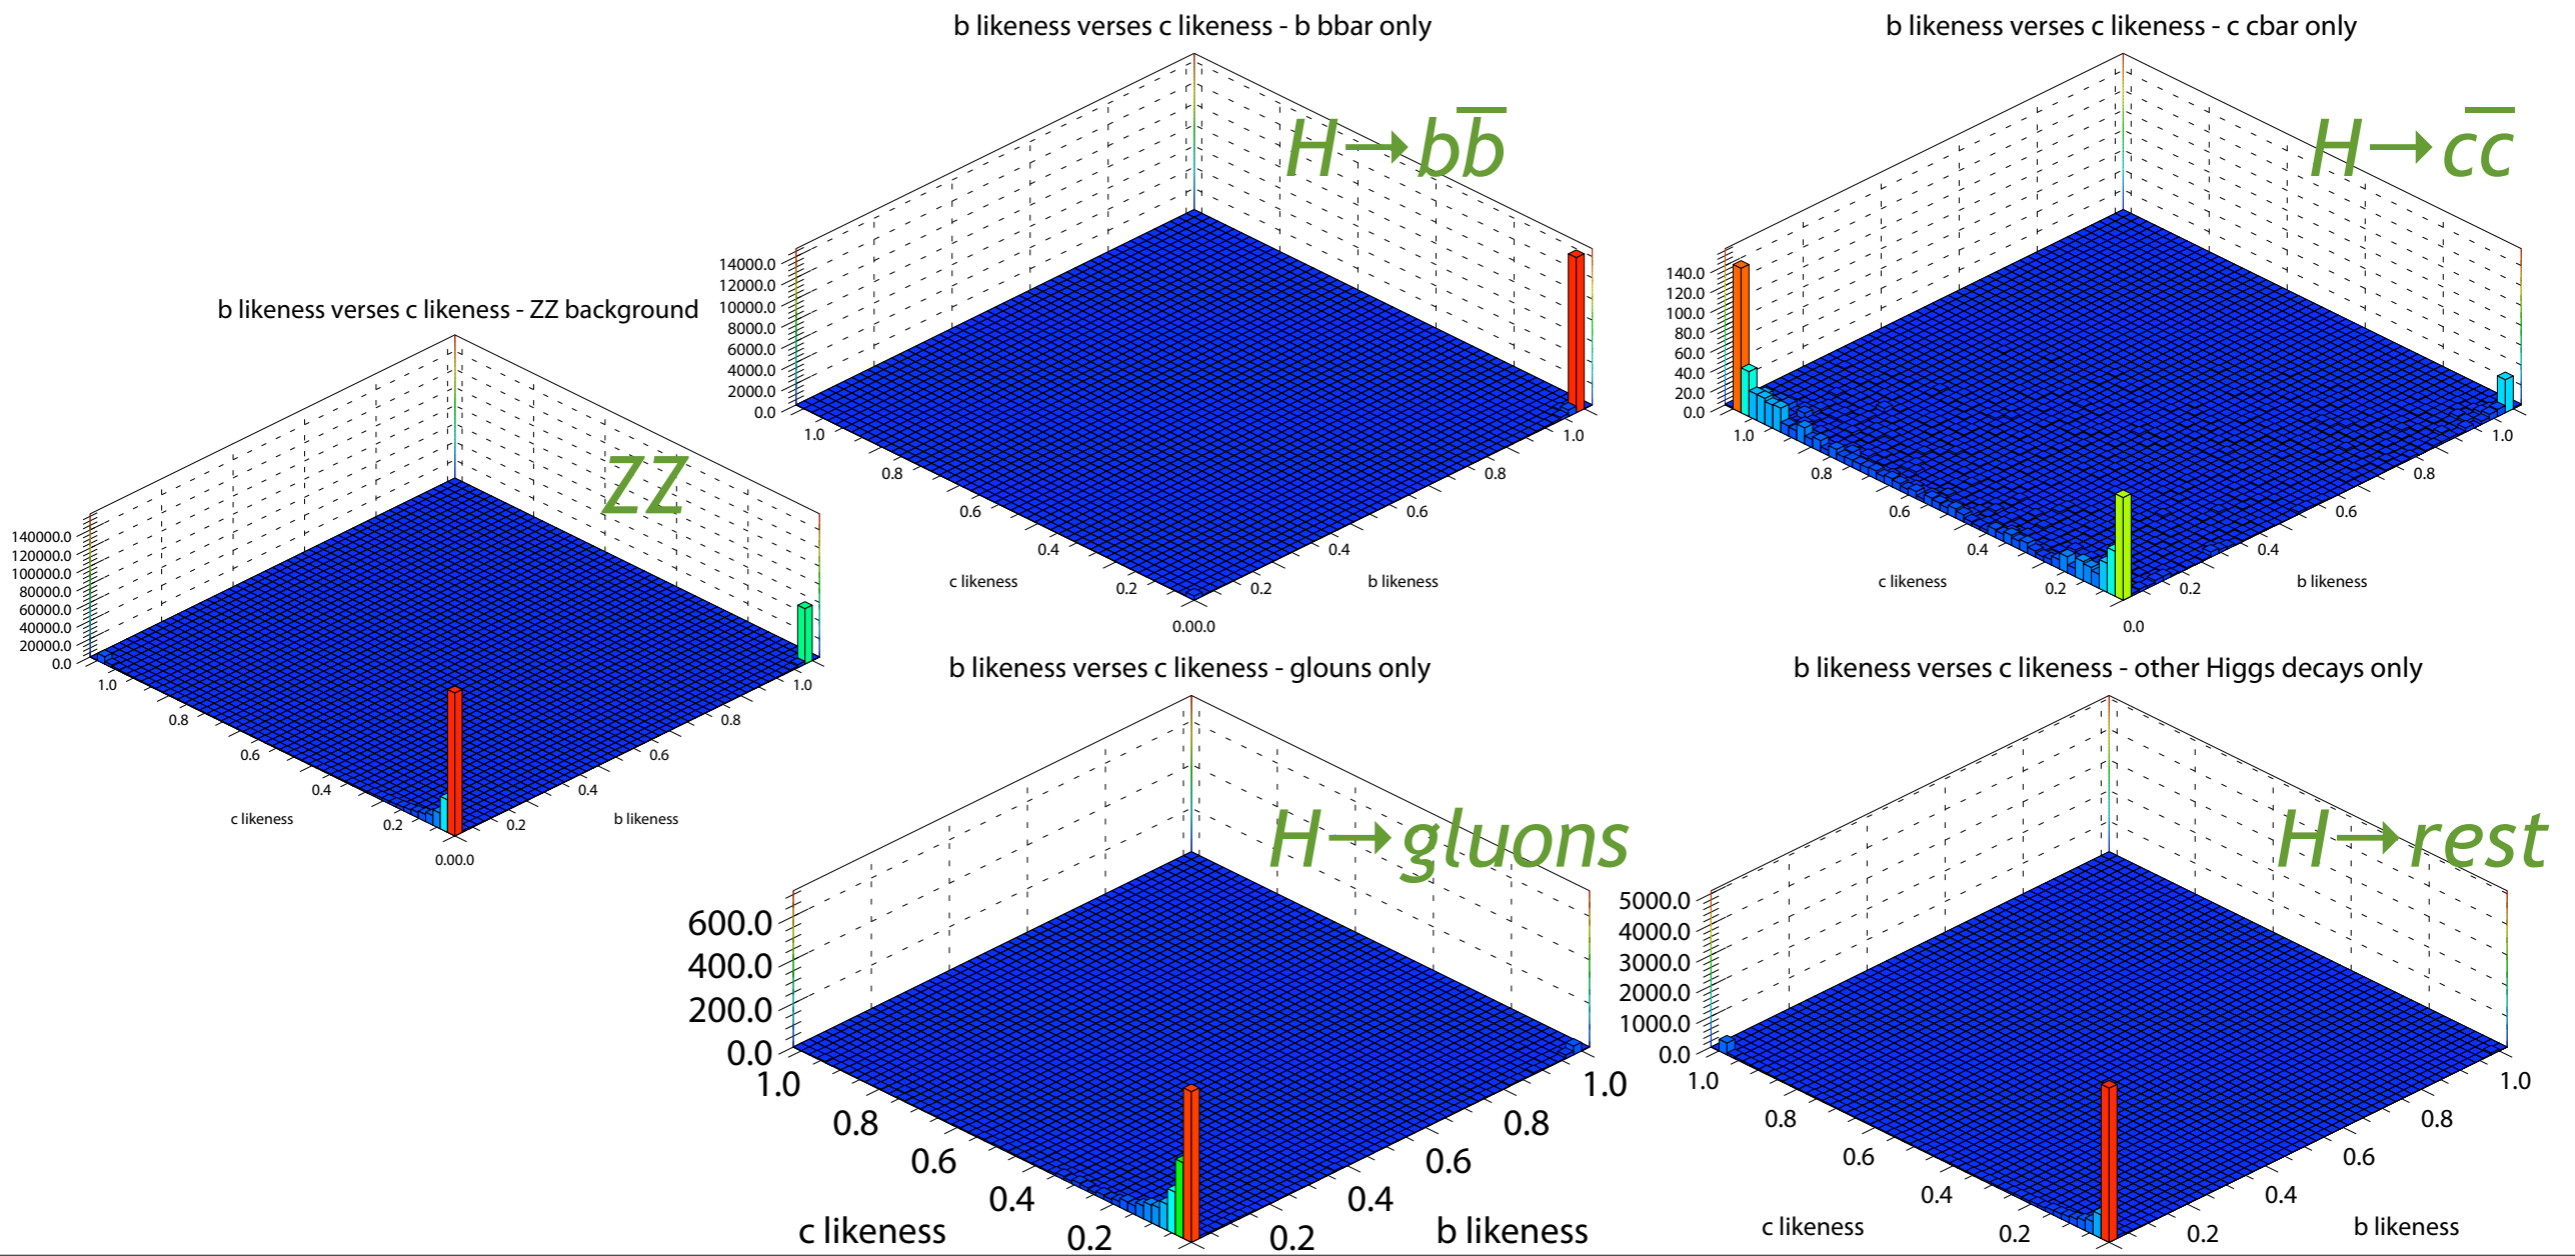

- $e^+e^- + 2$ jet events
- After removing the two electrons, and re-clustering with 2 jets.
- Following Kuhl and Desch, look at the jet kinematics to separate background and signal

$b\bar{b}$ and $c\bar{c}$ likeness

Mark Grimes

- Define the likeness variables, for a pair of jets, using the b and c NN tag values:
 - b -likeness = $(b_1 \cdot b_2) / (b_1 \cdot b_2 + (1 - b_1) \cdot (1 - b_2))$
 - c -likeness = $(c_1 \cdot c_2) / (c_1 \cdot c_2 + (1 - c_1) \cdot (1 - c_2))$
- Good discrimination between $H \rightarrow b\bar{b}$, $H \rightarrow c\bar{c}$ and ZZ
- Will use these as templates to fit to the observed distribution

Summary and Conclusions

- The software is finally ready for a reasonable analysis of the Higgs branching ratios.
- We are starting to develop a strategy for our analysis.
 - Can't use just the DST information. Need to:
 - identify leptons, remove and re-cluster
 - tune and re-run b and c tagging for this signal
 - Use b -tag and c -tag likeness variables to fit for $ZH(\rightarrow b\bar{b})$, $ZH(\rightarrow c\bar{c})$ and ZZ .
- We intend to keep working on this analysis, however manpower is becoming an issue. We are happy to collaborate with other groups.
